OS-NMAP LIVE HOST DISCOVERY

AIM :-

Discover live active host in a network using scans such as ARP, ICMP, TCP & UDP.

OBJECTIVE :-

To understand how nmap identifies active system before performing further network scanning.

SOFTWARE :-

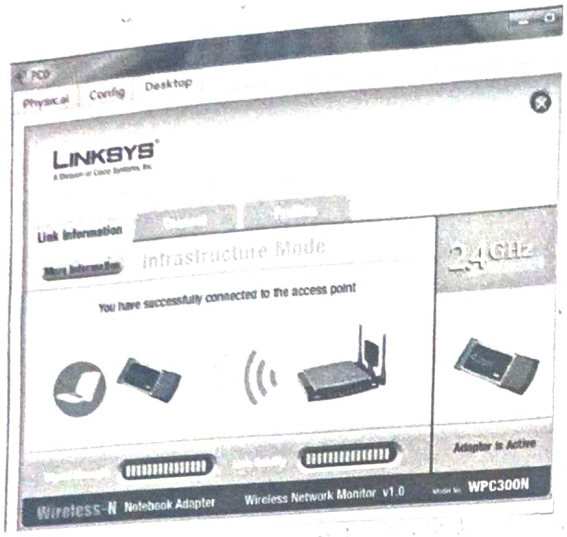

n-map
Try hack N map room / attack box computer with network access.

THEORY :-

N-map is a free and open-source network scanning tool used to discover live hosts and identify network services it was created.

N-map was different live hosts using different protocols.

1) ARP scan - use arp scans requests to find host on same subnet.

2) ICMP scan - use ICMP request & replies to identify.

3) TCP scan - use TCP request and packet to specified ports & check the response.

4) UDP scan - send UDP packets and can identify an active host through an ICMP port unreachable.

RESULT :-

Thus, the live host discovering using N-map was successfully studied & performed.
